

# SUSTAINABILITY ALERT

## Title: GENERATOR DRIP TRAYS

Generators on our sites are stationed in drip trays which we fabricated to contain any spills of fuel or oil that could cause ground contamination and disrupt the local ecosystem. The drip trays are removable and enable safe disposal of residues. This is a simple, practical and cost effective solution.

Using welded steel trays which can be made from scrap saves on cost too. Ensure stand folds are welded to prevent spillage inside the tray leaking through corner up stands. Disposal of residues and contaminated materials should be in both a safe and environmentally friendly manner. Refer to federal legislation pertaining to environmental protection - Federal Law 24 articles 35, 43, and 61.
