

SUSTAINABILITY ALERT

Title: WASTE SPILLAGE CONTROL

Al Futtaim Carillion P & T department is using a mobile spill control unit to counter the spillage. The speciality of this spill control unit is that the whole unit is made from waste materials. The trolley is made from metal waste generated in the fabrication work shop while waste drums are used to store the clean and contaminated saw dust. In this unit waste saw dust is used as spill absorbent which is also free and procured from the carpenter work shop. This unit can easily move from one place to another place for use.

Sun Diagram Impact Area(s): Resource Use.

Business Benefits: Cost of procuring a spill kit and the cost to landfill avoided.

Community Benefits: Reusing of several materials is a key aspect of waste management which reduces the environmental impact on site whilst giving the place a clean and aesthetic look, devoid of waste materials strewn around.

Good example of reusing materials, good initiative. Disposal of residues and contaminated materials should be in both a safe and environmentally friendly manner. Refer to federal legislation pertaining to environmental protection - Federal Law 24 articles 35, 43, and 61.
